

Cosmo — 6-Month Launch & Growth Plan

August 1, 2026 – January 31, 2027 · Total budget: ₹15,00,000

— What Cosmo is

A quick-commerce app for premium healthy snacks. Every product is health-scored 0–10 with a plain-English explanation of why it is good or bad.

How Cosmo earns: all stock is on consignment — brands are paid only after their product sells. Cosmo keeps ~28% of every sale as commission. No cash is tied up in inventory.

— The plan in one paragraph

Launch the app on August 1 (Android; iPhone ~10 days later). Grow from zero to **400 orders/month** by January using mostly low-cost channels (housing-society WhatsApp groups, referrals, small paid influencers, flyers), with paid Instagram/Facebook ads as a carefully capped amplifier. Every rupee is pre-allocated, every channel has a written kill-rule if it underperforms, and 12% of the budget is locked away as contingency that cannot be touched without a proven reason.

— Budget at the highest level

Block	Amount
Team & fixed costs (developer, designer, ops hire, tools)	₹4,88,000
Growth spending (ads, influencers, referrals, creative, retention)	₹8,32,000
Contingency — held back, locked, released only against proof	₹1,80,000
Total	₹15,00,000

Section 3 shows the assumptions. They are deliberately conservative — the plan is designed to work even if reality comes in at the low end.

— Headline targets (6 months, conservative case)

3,600 App downloads (installs)	720 Customers acquired	1,680 Total orders delivered
₹9.67L Total sales through the app (GMV)	₹2.71L Cosmo's commission income (28%)	400/mo Orders run-rate by January
30–35% Repeat rate target — customers who order again within 14 days	≤ ₹200 Blended cost to acquire one customer (kill line at ₹300)	

How to read this document. Sections 2–3 explain the model and the assumptions. Sections 4–5 show where every rupee goes. Sections 6–7 show how growth happens and the monthly targets. Section 8 is the calendar, Section 9 the safety rules, Section 10 the honest summary. Appendices A–C hold the week-by-week calendar, a plain-language glossary, and best/worst-case scenarios.

2 The business model — how a single order makes money

— The model

- **Consignment stock:** brands place products with us free; we pay them only after a sale. Zero cash locked in inventory.
- **28% commission** on the pre-GST price of every sale is Cosmo's revenue.
- **Own delivery:** our existing driver + Adi deliver. No delivery salary is drawn from this budget.
- **One pincode (400050)** until January. Density in one neighbourhood (Bandra West) makes delivery cheap and word-of-mouth strong.

— A single order, in rupees (conservative case)

Item	Amount
Average order value (basket)	₹500
Cosmo's commission (28%)	approx. ₹140
Delivery cost from this budget	₹0
Contribution per order	approx. ₹140

— Customer lifetime math (6-month view, conservative)

Item	Value
Orders per retained customer per month	1.5
Average orders per acquired customer over 6 months	~2.5
Lifetime contribution per customer (2.5 × approx. ₹150)	approx. ₹375
Maximum allowed acquisition cost (kill line, any channel)	₹300
Blended acquisition cost target	≤ ₹200

— The one number that shapes the whole plan

A paid ad install costs approx. ₹50, and about 1 in 5 installers places an order. So a customer acquired through paid ads costs **approx. ₹250** — but their first order earns us only **approx. ₹140**.

Conclusion: paid ads only pay back when customers order a second and third time. That is why (a) cheap channels — society groups, referrals, flyers, small influencers — must deliver ~69% of all installs, (b) paid ads are capped and killed fast if expensive, and (c) repeat rate is the single most-watched metric in this plan.

— Cost to acquire a customer, by channel

The customer is worth approx. ₹375 over six months — so every channel must stay under ₹300, and the blend under ₹200. Any channel that costs more than ₹300 per first order at two consecutive fortnightly reviews is shut down and its budget moved to the best performer (full rules in Section 9).

3 Assumptions — every number below is built from these

Cosmo is pre-revenue today, so the plan runs on stated assumptions rather than history. Each was chosen at the pessimistic (bear) end of the realistic range, and each is replaced with real data within 3–4 weeks of launch. If reality beats these, the plan over-delivers; the plan is not allowed to depend on optimism.

Assumption	Value used	Why this value	Replaced by real data
Average order value (AOV)	₹500 (Aug–Sep) → ₹550 (Oct) → ₹600 (Nov–Jan)	2–3 premium snack items per basket; festive gifting lifts it slightly. The ~150-product catalogue could support more cross-selling, but we don't assume it.	Week 3 actuals
Cosmo's take rate	28% of pre-GST sales	Standard consignment commission already agreed with reference brands.	NA
Install → first order conversion	20%	Hyperlocal, high-intent installs convert well; 20% is the cautious end.	Week 4 actuals
14-day repeat rate	25% at launch, rising to 35% by Nov	Snacks are a replenishment category; 25% is the floor we must beat for the model to work.	Weekly cohort tracking
Orders per retained customer	1.5 / month	Fortnightly snack restocking cadence.	Month-2 cohorts
Paid ad cost per install (Meta)	₹50	Small-radius targeting in Mumbai is expensive; ₹30–40 is the good case, so we are assuming ₹50.	First ₹10,000 spent
Organic/referral/society install cost	₹0–20	Society forwards and flyers cost printing only; referral credit approx. ₹200 per activated customer.	Ongoing, per promo code

How we know within weeks — not months — whether it's working: every install source carries its own discount code (society, flyer, referral, each influencer, each ad). The daily tracking sheet shows exactly which channel produced which install and which order. There is no ambiguity about what is working: each channel gets a written verdict (keep / kill / scale) every two weeks.

Appendix C shows what happens to the plan if these assumptions come in better or worse than expected.

4 The ₹15,00,000 — where every rupee sits

— Monthly all-in spend (full transparency, including salaries)

Line	Aug	Sep	Oct	Nov	Dec	Jan	Total
Rohit — developer	50,000	50,000	50,000	50,000	50,000	50,000	3,00,000
Avirup — designer (retainer Aug; per-assignment after)	15,000	5,000	8,000	8,000	5,000	5,000	46,000
Brand-ops associate (new hire, starts Sep 1)	0	20,000	20,000	20,000	20,000	20,000	1,00,000
Tech stack (servers, database, maps, tools)	5,000	5,000	5,000	5,000	5,000	5,000	30,000
Claude (AI assistant subscription)	2,000	2,000	2,000	2,000	2,000	2,000	12,000
Growth spending (detail in Section 5)	1,15,000	1,24,000	1,59,000	1,79,000	1,41,000	1,14,000	8,32,000
Monthly total	1,87,000	2,06,000	2,44,000	2,64,000	2,23,000	1,96,000	13,20,000
+ Contingency (locked, see right)							1,80,000
Grand total							15,00,000

Spend ramps up ~18%/month into the Diwali window (Nov 8) — when festive buying intent is highest — then tapers. The driver and Adi's own time are not drawn from this budget.

— Monthly spend vs Cosmo income

Bars show spend; the second figure is Cosmo's commission income that month — the gap narrows every month as repeats build.

— Team decisions already made to protect the budget

- **Designer moved off retainer:** all app-redesign screens finish by Aug 15; from Sep 1 Avirup works per-assignment on a fixed rate card (₹500–1,500 per item, 48-hour turnaround). Saves approx. ₹44,000 vs keeping the ₹15,000 retainer.
- **One ops hire at ₹20,000/month (Sep 1):** with ~150 products to keep accurate (nutrition data, photos, listings) plus continuous brand onboarding, this work cannot sit with one founder.
- **No agencies, no professional shoots:** all creative made in-house with AI tools + phone photography, polished by Avirup.

— The contingency lock (₹1,80,000 = 12%)

- Untouchable before October 1.
- Released only in tranches of ≤ ₹60,000, maximum twice, and only into a channel that is currently **beating** its target.
- The final ₹60,000 is never released — it is the guarantee that the ₹15,00,000 ceiling holds no matter what.

Money coming back: Cosmo's approx. ₹2,70,000 of commission income over the 6 months is treated as runway extension — it is not spent inside this plan.

5 Growth spending — ₹8,32,000 by month and category

Category	Aug	Sep	Oct	Nov	Dec	Jan	Total
Paid Meta ads (Instagram/Facebook, 2.5km radius around Bandra West)	35,000	39,000	64,000	79,000	59,000	38,000	3,14,000
Paid nano-influencers (2–3 small local creators/month @ approx. ₹5,000 each)	15,000	15,000	15,000	15,000	15,000	15,000	90,000
Referral & first-order discounts (₹100 off first order; ₹100 credit to referrer)	25,000	30,000	35,000	40,000	35,000	30,000	1,95,000
Creative & print (AI tools, Canva, 2,000 flyers, rating cards in every bag)	20,000	8,000	12,000	14,000	8,000	8,000	70,000
Retention (WhatsApp business messaging + win-back offers to lapsed customers)	7,000	10,000	12,000	12,000	12,000	12,000	65,000
Diwali festive (gifting creative, printed gift-tags, festive discount code)	0	5,000	21,000	15,000	2,000	2,000	45,000
App-store visibility (review push credits, store listing work, small Google test)	13,000	17,000	0	4,000	10,000	9,000	53,000
Growth total	1,15,000	1,24,000	1,59,000	1,79,000	1,41,000	1,14,000	8,32,000

— Where the growth money goes (share of ₹8.32L)

— Why the mix looks like this

- **Paid ads are deliberately NOT the biggest bet.** They are the most expensive way to buy a customer (Section 2), so they are the amplifier, not the engine. Daily budgets: ₹1,150/day in Aug rising to ₹2,650/day at Diwali peak, then down.
- **Referral is the second-biggest line** because a referred customer costs approx. ₹200 and arrives pre-trusted by a friend — better economics than any ad.
- **Influencers are paid, small, and measurable:** every creator gets a personal discount code, so we know exactly how many installs each ₹5,000 produced. Under 15 installs = never rebooked; every deal includes ad-usage rights.

Diwali is a tag, not a production. The festive push (Nov 8) is deliberately low-effort: 15–20 of our highest-scored existing products get tagged into an in-app "Diwali Gifting" collection with a 15% discount code and a printed gift-tag in the bag. No custom hampers, no assembly, no packaging production — festive revenue without festive operational risk.

No spend without a per-week task list. Behind this summary sits a 26-week execution playbook: every week has a spend number, a goal, and numbered tasks (which ads to launch at what daily budget, which messages to send, which buildings get flyers). This document shows the "what and why" — the playbook is the "how, day by day." Appendix A summarises it week by week.

6 The growth engine — five channels, each with a measured cost and a kill line

Channel	How it works	What we measure	Target	Kill line	Verdict by
Housing-society WhatsApp groups	One resident "champion" per building forwards our message to the society group; every neighbour gets ₹100 off, the champion earns ₹200 credit per 5 orders. Target 15 buildings by Sep.	Installs per society per month (own code per building)	15	8	Week 6
Referral	Existing customer shares a personal code; friend gets ₹100 off, customer gets ₹100 credit. Doubled during Diwali and New Year windows.	Cost per activated new customer	₹200	₹300	Week 6
Paid Meta ads	Instagram/Facebook app-install ads, 2.5km radius, three audiences tested against each other; losers get cut weekly and winner's budget gets doubled.	Cost per install; install → order %	₹40; 20%	₹60; 15%	First ₹15,000 spend
Paid nano-influencers	2–3 local food/health creators per month, approx. ₹5,000 per reel+story, personal discount code each, ad-usage rights included.	Installs per collab	40 (₹125/install)	15 (₹333)	Per collab
Flyers / QR	2,000 A5 flyers into building lobbies and under doors during delivery downtime; QR routes automatically to the right app store.	Installs per 1,000 flyers	25	10	Week 4

— Installs by channel, by month (how 3,600 downloads happen)

Month	Organic / app store	Societies	Paid ads	Referral	Flyers	Total
Aug	70	140	100	40	50	400
Sep	80	150	140	80	50	500
Oct	100	170	220	140	70	700
Nov	120	190	270	180	90	850
Dec	100	140	220	140	50	650
Jan	90	110	170	100	30	500
Total	560	900	1,120	680	340	3,600

— Retention — the quiet half of the engine

- A personal WhatsApp message from Hayagreeva 24 hours after every delivery, asking one line of honest feedback — these drive repeat orders.
- Weekly "Shelf Drop" broadcast every Sunday: what's new, what scored well. Think of this like Cosmo's in-app content. Will look like a magazine and have 2–3 articles.
- Win-back: any customer inactive 21 days gets a ₹75 credit; 30+ days a stronger offer.
- Review-for-credit programme (₹50 off) builds app-store ratings — the cheapest install source of all.

First week of launch runs with zero paid ads — the first ~50 customers come from personal network and societies, proving the app → order → delivery loop works before money is spent on traffic.

7 Month-by-month targets — the full funnel, no round guesses

Each month's orders = (new installs × 20% who place a first order) + (existing customers × repeat purchasing at 1.5 orders/month). Sales = orders × average basket. Cosmo's income = 28% of sales.

Month	New installs	New customers (20%)	Repeat orders	Total orders	Avg basket	Sales (GMV)	Cosmo income (28%)	All-in spend
Aug	400	80	30	110	₹500	₹55,000	₹15,400	₹1,87,000
Sep	500	100	70	170	₹500	₹85,000	₹23,800	₹2,06,000
Oct	700	140	120	260	₹550	₹1,43,000	₹40,040	₹2,44,000
Nov (Diwali Nov 8)	850	170	190	360	₹600	₹2,16,000	₹60,480	₹2,64,000
Dec	650	130	250	380	₹600	₹2,28,000	₹63,840	₹2,23,000
Jan	500	100	300	400	₹600	₹2,40,000	₹67,200	₹1,96,000
Total	3,600	720	960	1,680	—	₹9,67,000	₹2,70,760	₹13,20,000

— How to read this honestly

- **The business does not break even in these 6 months** — nor is it meant to. ₹13.2L of spend produces ₹2.7L of commission income. What the money buys is a **proven, measured customer machine**: known cost per customer, known repeat rate, known basket size, in one dense neighbourhood.
- Notice the shape: by Dec–Jan, **repeat orders overtake new-customer orders** (300 of Jan's 400 orders are repeats). That is the signature of a real business rather than a discount-fuelled spike.
- August installs are Android-only; the iPhone app arrives ~Aug 8–11 and all later months include both stores.

— Orders per month: repeat orders take over

Dark = new customers · Green = repeat orders.

— What January's exit numbers mean

January run-rate	Value
Orders per month	400
Monthly sales through the app	₹2,40,000
Cosmo monthly income	₹67,200
Annualised sales run-rate	approx. ₹29,00,000

From one pincode. The expansion argument then writes itself: each additional pincode is a repeat of a proven playbook, funded by a proper seed round raised on this data (Section 8).

8 The roadmap — what happens when

Window	Milestone	What actually happens
Jul 21–31	Pre-launch	App v2 redesign kickoff with developer (all screens finalised by Aug 15); ~150 products loaded with scores, nutrition data and photos (top 40 first); iPhone version submitted for Apple review; payment gateway, test deliveries, food-license application all verified.
Aug 1	LAUNCH (Android)	App goes live at 6pm. Personal network + first 5 housing societies activated with launch codes. 2,000 flyers printed and distribution starts. Week 1 runs with zero paid ads — organic first, to prove the machine.
Aug 8–14	iPhone launch + ads on	App Store goes live (~Aug 8–11); iPhone contacts re-messaged. First Meta ad campaign starts at ₹1,500/day across 3 test audiences. First 2–3 paid influencer collabs booked. Ops-hire job posting goes out.
Aug 15–31	First verdicts	First ad checkpoint (kill weak audiences), referral programme live, first repeat-rate reading, ops associate interviewed and offered (Sep 1 start), designer moved to per-assignment basis. Month goal: 400 installs, 110 orders.
Sep	Scale what worked	Associate onboarded (products, brand admin, data). 15 societies active. App v2 ships ~Sep 15 — the polished app arrives before the expensive traffic. First monthly metrics email to investor network (funds I have already spoken to before). Month goal: 500 installs, 170 orders.
Oct	Diwali build-up	Diwali Gifting collection live Oct 10 (existing products tagged + 15% code). Ads step up to approx. ₹2,550/day. Oct 25 demand checkpoint decides whether extra festive ad money is justified. Month-end: fundraise data pack built from real numbers. Goal: 700 installs, 260 orders.
Nov 1–8	Diwali peak	Ad spend peaks at ₹3,500/day on gifting creative. Normal delivery ops — a festive order is a normal order with a printed gift-tag.
Nov 3–5	Fundraise restart	Seed-round conversations restarted with warm investors (IPV, Titan, Kriscore, Elevation and others) using October's real data. Meetings run mid-Nov onwards. Goal: 850 installs, 360 orders in Nov.
Dec	Efficiency month	Only proven ads run. 100+ app-store reviews pushed. "12 Days of Healthy Snacking" repeat-frequency campaign. Year-end data email to the full investor pipeline. Goal: 650 installs, 380 orders.
Jan	New-Year surge + close	Health-resolution campaign meets January's cheapest ad prices. Referral credits doubled for 2 weeks. Final pilot report: full funnel, cohort curves, channel costs — the seed-round data room. Expansion decision (next pincode vs deepen) made on data. Goal: 500 installs, 400 orders/month run-rate.

Appendix A breaks this into the full week-by-week execution calendar with spend and goals per week.

9 Why the ₹15,00,000 cannot be quietly lost — the written kill rules

The biggest risk in the growth budget would mostly be a slow bleed into channels that aren't working. This plan pre-commits, in writing, to what gets shut down and when. These rules override enthusiasm.

Rule	Trigger → action
Ad cost gate	If installs cost over ₹60 after the first ₹15,000 of ad spend → pause, rebuild ads, retest with ₹5,000. Two failed retests → ads capped at ₹500/day permanently; budget moves to referral and societies.
Funnel gate	If fewer than 15% of paid installers place an order (after 200 installs) → stop buying traffic entirely until the app's first-order experience is fixed.
Channel kill	Any channel costing over ₹300 per first order at two consecutive fortnightly reviews → shut down, budget to the best performer. No sentimental channels.
Repeat-rate circuit breaker	If under 20% of customers reorder within 14 days at any month-end → next month's acquisition spend cut 40%, moved to retention and product fixes.
Influencer rule	Any creator under 15 installs per collab is never rebooked (use their personal code as proof). If the whole channel averages under 20, it drops to one experimental collab per month.

Rule	Trigger → action
Monthly cap	No month may exceed its budget by more than 15%, even when reallocating — overruns must be funded by same-month cuts, never borrowed from future months.
Contingency lock	₹1,80,000 untouchable before Oct 1; released max twice, ≤ ₹60,000 each, only into a channel beating its target; final ₹60,000 never released.
Diwali borrow	Extra festive ad money (max ₹20,000, from December's line) is allowed only if 60+ festive-collection orders exist by Oct 25.
The Nov 30 tripwire	If by Nov 30 customers cost over ₹300 AND fewer than 20% reorder — the model isn't working. All growth spend freezes. Remaining budget converts to approx. ₹85,000/month of survival mode (team + retention only), buying ~3 extra months to fix the product rather than burning out on ads.

— The operating rhythm that enforces this

- **Daily (15 min):** installs, orders, sales, spend — logged by source code.
- **Weekly (Sunday):** goals checked against the playbook; worst ad cut, best ad doubled.
- **Fortnightly:** every channel gets a written keep / kill / scale verdict.
- **Monthly (the 1st):** full close against this plan; next month's budgets set by the rules above, not by mood.

10 What the ₹15,00,000 buys — and the honest risks

— By January 31, 2027, success looks like:

Outcome	Measure
A working store in customers' pockets	3,600 installs, both app stores, 100+ reviews
A real customer base in one neighbourhood	720 customers, 400 orders/month
Proof people come back	30–35% reorder within 14 days
A known cost to buy a customer	≤ ₹200 blended, per-channel breakdown
Revenue flowing	₹2.4L/month sales; ₹67k/month to Cosmo
A seed-round data room	6 months of cohort, cost and margin data
Budget discipline demonstrated	₹15L ceiling held; kill-rule history documented

The strategic point: this ₹15,00,000 converts an idea into a measured machine.

— The honest risks (and what limits each)

Risk	Limiter
People don't reorder (the fatal one)	Watched weekly from Week 3; circuit breaker cuts acquisition 40% and redirects to fixing the product; Nov 30 tripwire converts budget to runway.
Ads cost more than planned	₹50/install is already the pessimistic case; gates at ₹15,000 of spend; 69% of installs come from non-ad channels anyway.
High number of SKUs overwhelm founder	Ops associate from Sep 1; top products prioritised at launch; AI handles drafting and data work.
Apple review delays iPhone launch	Submitted in July, ahead of need; Android carries launch regardless.
Diwali festive bet flops	It's a tag on existing products + a discount code — near-zero sunk cost, checkpoint on Oct 25 before any extra money follows it.
Founder bandwidth	20–30 focused hrs/week + associate + a written week-by-week playbook so no time is spent deciding what to do next.

The commitment: ₹15,00,000 is a hard ceiling. Money moves between channels only by the written rules, the contingency stays locked, and every month closes with a full account of actuals against this plan.

A Appendix A — the week-by-week execution calendar

The condensed version of the 26-week playbook: what each week costs, what it must achieve, and its main actions. The full playbook adds numbered day-level tasks under each week.

Week	Spend	Focus & goal
W0 · Jul 21–31	₹0	Pre-launch: v2 design kickoff, ~150 products loaded, iPhone submitted, launch checklist done.
W1 · Aug 1–7	~₹30k	LAUNCH. Codes + tracking live, 5 societies, flyers printed. Goal: 80 installs, 20 orders. No paid ads.
W2 · Aug 8–14	~₹27k	Meta ads on (₹1,500/day), iPhone live, first influencer collabs, hire posting. Goal: ad cost baseline.
W3 · Aug 15–21	~₹28k	Referral live; first ad checkpoint — weak audiences cut. Goal: 250 cumulative installs, 60 orders.
W4 · Aug 22–31	~₹25k	Month close vs plan; win-back flow on; associate offered; designer restructure. Goal: 400 installs, 110 orders.
W5–6 · Sep 1–14	~₹65k	Associate onboarded; scale winning ads; 15 societies; investor update #1.
W7–8 · Sep 15–30	~₹65k	App v2 ships ~Sep 15; Diwali collection defined. Goal: 500 installs, 170 orders, repeat ≥28%.
W9–10 · Oct 1–14	~₹85k	Diwali Gifting collection live Oct 10; ads step up; contingency decision #1.

Week	Spend	Focus & goal
W11–12 · Oct 15–31	~₹85k	Pre-Diwali peak; Oct 25 demand checkpoint; fundraising data pack built. Goal: 700 installs, 260 orders.
W13–14 · Nov 1–14	~₹1.0L	Diwali peak (Nov 8) + fundraising restart emails Nov 3–5; gift-tag conversion push after.
W15–16 · Nov 15–30	~₹80k	Investor meetings; full kill-rule review; Nov 30 tripwire check. Goal: 850 installs, 360 orders.
W17–18 · Dec 1–14	~₹78k	Efficiency: proven ads only; 100+ reviews push; "12 Days of Healthy Snacking".
W19–20 · Dec 15–31	~₹75k	Hold through holidays; year-end investor email; January campaigns pre-built. Goal: 650 installs, 380 orders.
W21–23 · Jan 1–21	~₹70k	New-Year health-resolution surge; referral credits doubled 2 weeks.
W24–26 · Jan 22–31	~₹40k	Close: final pilot report (the seed data room); expansion decision on data. Goal: 400 orders/month run-rate.

Standing routines every single week: daily 15-minute metrics log · WhatsApp follow-up 24h after every delivery · Sunday Shelf Drop broadcast · Sunday ads review (cut worst, double best) · fortnightly keep/kill/scale verdicts · monthly close on the 1st.

B Appendix B — every term in this plan, in plain language

Term	What it means here
Install / download	One person putting the Cosmo app on their phone. Not yet a customer — about 1 in 5 installers goes on to order.
Customer	Someone who has placed at least one paid order.
AOV (average order value)	The average bill per order — assumed ₹500 now, ₹600 by Diwali.
GMV (gross merchandise value)	Total value of everything sold through the app. Cosmo's own income is 28% of this.
Consignment	Brands give us stock free; we pay them only after their product sells. If it doesn't sell, it goes back — no money stuck.
Contribution per order	What one order actually leaves behind for Cosmo after paying the brand — approx. ₹140.
CAC (customer acquisition cost)	Total money spent to get one new paying customer, counted per channel. Target under ₹200 blended, hard limit ₹300.
CPI (cost per install)	What one app download costs when bought through ads — assumed ₹50.

Term	What it means here
14-day repeat rate	Of the people who ordered, what share order again within 14 days. The single most important health metric — target 30–35%.
Cohort	All customers who arrived in the same week/month, tracked together over time to see how they behave.
LTV (lifetime value)	Everything one customer is worth over time — approx. ₹375 over 6 months in the conservative case. Must be well above CAC.
Run-rate	Taking one month's number and multiplying by 12 — "if January continued all year." Useful for trajectory, not a promise.
Kill line / kill rule	A pre-written number at which a channel is automatically shut down or cut — decided now, when heads are cool, not later.
Contingency	₹1,80,000 (12%) kept locked away, released only in small tranches into things already proven to work.
ASO (app store optimisation)	Making the app rank and convert better in the Play Store / App Store — reviews, screenshots, keywords. The cheapest installs of all.
Nano-influencer	A local creator with a few thousand genuine followers — cheap (approx. ₹5,000), local, and measurable through a personal discount code.

C Appendix C — what if reality differs from the assumptions?

The plan's two most sensitive numbers are the repeat rate and the paid-ad install cost. Here is how the same ₹15,00,000 plays out if they land worse, as planned, or better. The plan's written rules adapt spending automatically in each case.

Scenario	If this happens...	...the plan automatically responds	Likely January outcome
Worse than planned Repeat under 20%, installs cost ₹60+	Customers try once but don't return; ads expensive. This is the scenario the kill rules exist for.	Acquisition spend cut 40% (circuit breaker); ads capped at ₹500/day; contingency stays locked; if still true on Nov 30, the tripwire freezes growth spend entirely and converts remaining budget into approx. 3 extra months of runway to fix the product.	Fewer orders (approx. 150–200/month) but ₹3–4L of budget preserved, a working app, and clear data on what to fix. The money is not lost to ads that weren't working.
As planned (bear case) Repeat 25 → 35%, installs approx. ₹50	The numbers in this document — every assumption at the cautious end.	The plan runs as written: spend ramps into Diwali, contingency releases only against proof, fundraise restarts in November on October's data.	400 orders/month, ₹2.4L monthly sales, 720 customers, 30–35% repeat — a fundable, proven machine in one pincode.
Better than planned Repeat 40%+, installs ₹30–40	Bandra's health-conscious crowd adopts faster than assumed; word-of-mouth compounds.	Budget moves toward the over-performing channels (free reallocation within the ceiling); contingency tranches ($\leq ₹60,000 \times 2$) release into proven winners; Diwali borrow activates if pre-Diwali demand is proven by Oct 25.	500–600+ orders/month and the same ₹15L ceiling — the upside is taken by moving money, never by adding money. The seed conversation happens from strength.

The design principle behind all three rows: the budget is fixed; only the allocation moves. Good news is rewarded with reallocation, never with overspend. Bad news triggers pre-written cuts, never hopeful doubling-down.

What would make us stop entirely: customers costing over ₹300 AND fewer than 1 in 5 reordering by Nov 30. At that point the honest conclusion is that the product needs work, not the marketing — and the remaining money buys time to fix it.
